

**General Routine Crusher Maintenance:**

Every crusher and its extra equipment must have regular, systematic checks. This will result in fewer failures and repairs, not to mention the downtime which is the most expensive part of your operation. Developing a comprehensive inspection and maintenance procedure will lower your overall operation costs.

For instance, a new machine should be inspected after a fairly short time of operation. The frequency of inspections can then be decreased as the machines proves to be working optimally.

It is important to keep a written record of inspections and maintenance.

Please contact Midsouth Machine & Service for help in setting up an inspection and maintenance program.

**DANGER**

*Lockout power source during  
installation, cleaning or servicing  
equipment or when making repairs.  
Failure to do so could result in severe  
bodily injury or death.*
